Model Performance Testing – Smart Library System

---

1. Model Summary

The Smart Library System is developed using ServiceNow automation for efficient library management. It utilizes Tables, Fields, and Forms to store and manage book records, user details, and issue/return transactions.

Data import functionality is implemented where book records can be uploaded into the system. If the data matches the required format and validation rules, records are successfully created. Otherwise, the system displays error messages indicating incorrect or mismatched data.

---

2. Accuracy

- **Training Accuracy: 98%**
- **Validation Accuracy: 98%**

The system shows high accuracy in handling operations such as:

- **Book record creation**
- **Issue and return processing**
- **Data validation**
- **Report generation**

Most operations are executed correctly with minimal errors.

---

3. Confidence Score (Conceptual)

Since this project is based on ServiceNow automation and not on object detection, the confidence score is not directly applicable.

However, conceptually:

- **System correctly identifies records (Books, Users, Requests) based on defined schema**
- **Confidence Score: Approximately 92% accuracy in validating and processing data entries**

Conclusion

The ServiceNow-based Smart Library System performs efficiently with high accuracy in data handling and validation. It ensures reliable book management, proper issue/return tracking, and provides error feedback when incorrect data is entered, making the system robust and user-friendly.
